NATIONAL GDP GROWTH PREDICTOR

Variables in Your Dataset

Your dataset contains country-level economic and digital indicators from 2001–2025.
Each row represents one country + one indicator.

Country Name

- Type: Categorical (String)
- Meaning: Name of the country or region
- Example: India, Afghanistan, United States

Used for:

- Country-wise comparison
- Filtering specific countries
- Group analysis (Developed vs Developing)

Country Code

- Type: Categorical (String)
- Meaning: 3-letter ISO country code
- Example: IND, AFG, USA

Used for:

- Data merging
- Unique country identification
- Avoiding spelling inconsistencies

Series Name (Indicator Name)

- Type: Categorical
- Meaning: Type of indicator measured

There are 2 indicators:

GDP per capita (current US$)

- Economic indicator
- Average income per person in US dollars
- Formula:
  [
  GDP\ per\ capita = \frac{Total\ GDP}{Population}
  ]

Shows:

- Standard of living
- Economic growth level

Individuals using the Internet (% of population)

- Digital development indicator
- Percentage of population using internet

Shows:

- Technology adoption
- Digital penetration
- Infrastructure development

Series Code

- Type: Categorical
- Meaning: Unique code for indicator

Examples:

- NY.GDP.PCAP.CD → GDP per capita
- IT.NET.USER.ZS → Internet usage %

📌 Used for:

- Programmatic filtering in Python
- Automated indicator selection

Year Variables (2001–2025)

Example columns:

2001 [YR2001]

2002 [YR2002]

...

2025 [YR2025]

- Type: Numerical (should be converted from string)
- Meaning: Value of the indicator in that specific year

📌 Important:

- These are the actual measurable data
- Used for time-series analysis

- Used for regression modeling

Variable Types Summary

Variable	Type	Role
Country Name	Categorical	Identifier
Country Code	Categorical	Identifier
Series Name	Categorical	Indicator Type
Series Code	Categorical	Indicator ID
Year Columns	Numerical	Measured Values

For our ML Project

- Independent Variable (X):

Internet Usage %

- Dependent Variable (Y):

GDP per capita

Because you are likely analyzing:

Does increase in internet penetration influence GDP per capita?

Dataset Nature

This is:

- Panel Data
- Multivariate dataset
- Time-series + Cross-sectional combined
